Migrate resource to Terraform

- Let's simulate the migration of a resource: Create an Azure Container Registry with Basic SKU in a resource group
- Then, try one of these options to do the Terraform code:

Migrate ARM or Bicep template manually extracted to Terraform

Try to generate it with **azdtfexport**
<https://github.com/Azure/aztfexport>

Use Terraform import to generate it
<https://developer.hashicorp.com/terraform/tutorial/s/state/state-import#define-import-block>

- Create a new folder called **digital_infra_share** and add this terraform code to it.
